1. Introduction:

MySQL is an open-source database management sof organize, and later retrieve data. It has a variety of o nuanced permissions within the tables and databases overview of a few of the many options.

How to Create a New User:

While logging from root user MySQL, it would have full a

However, in cases where more restrictions may be requ

users with custom permissions. Initially log in from root u

a new-user from root. We can create user within the M

```
USER 'newuser'@'localhost' IDENTIFIED BY 'passwor
```

At this point the new-user has no permissions to do ar fact, even if new-user tries to login (with the password, p to reach the MySQL shell. Therefore, we would provid information they will need. A strong password should l lower case and special character.

```
mysql> GRANT ALL PRIVILEGES ON *
```

Once you have finalized the permissions that you want always be sure to reload all the privileges.

```
mysql> FLUSH PRIVILEGES;
```

1.2 How To Grant Different User Permissions

Here is a short list of other common possible permissio

1. ALL PRIVILEGES- as we saw previously, this wo access to a designated database (or if no databa across the system)
2. CREATE- allows them to create new tables or datab
3. DROP- allows them to them to delete tables or data
4. DELETE- allows them to delete rows from tables
5. INSERT- allows them to insert rows into tables
6. SELECT- allows them to use the SELECT comman
7. UPDATE- allow them to update table rows
